- 

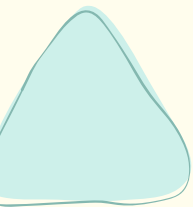

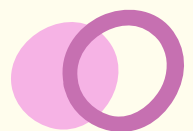

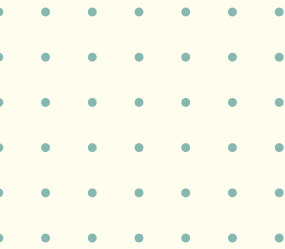

INTRODUCTION

for our group project, we decided to make a database for a kindergarten, it will contain the needed entities, attributes, relationships and more!
we hope it strikes your interest!~

BUSINESS RULES

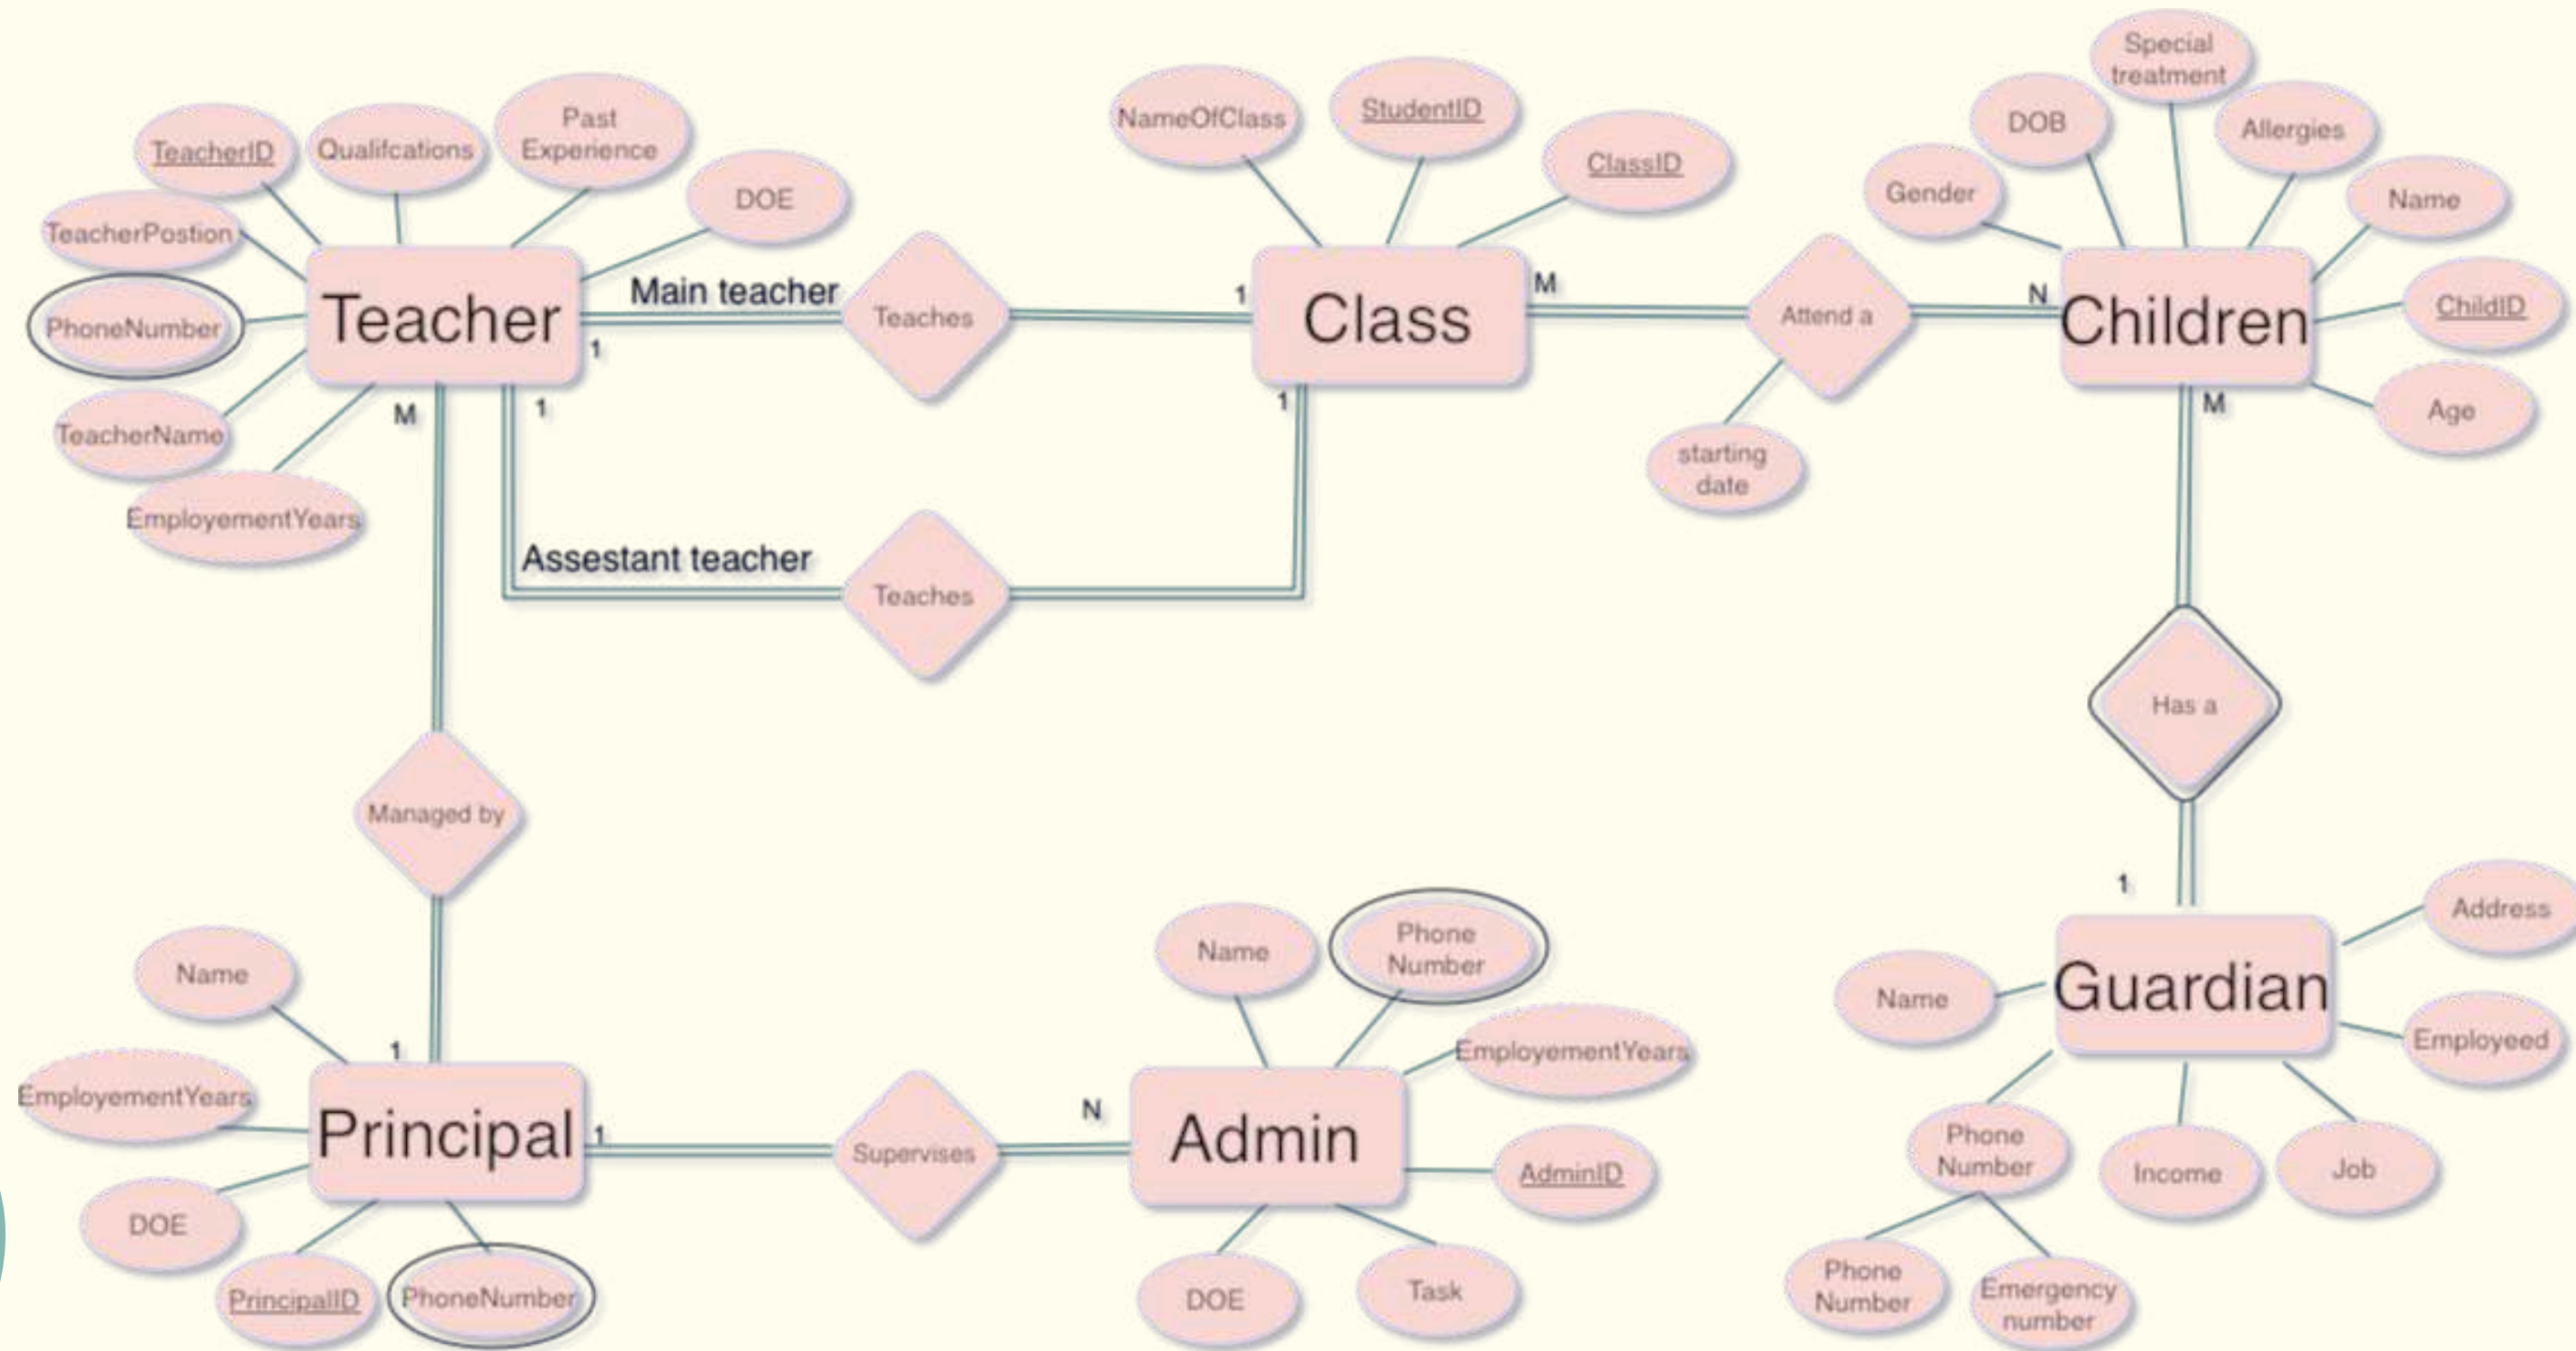

- the staff in the kindergarten consist of teachers, administrators and a principal.
- multiple children are supervised by one teacher.
- Each main teacher has exactly one assistant teacher, the assistant teacher assists the main teacher in their designated class.
- every child has a name, Parent name, ID, DOB, gender, chronic illness?, special treatment?, allergies?.
- every parent has a name, phone number, relation, salary, employed?, address, emergency phone number.
- every teacher has a Name, phone number, ID, teaching position, qualifications, DOE, past experience.
- the principal has a name, ID, phone number, qualifications, annual budget, DOE, Employment Years.
- the principal manages the teachers and supervises the administrators.

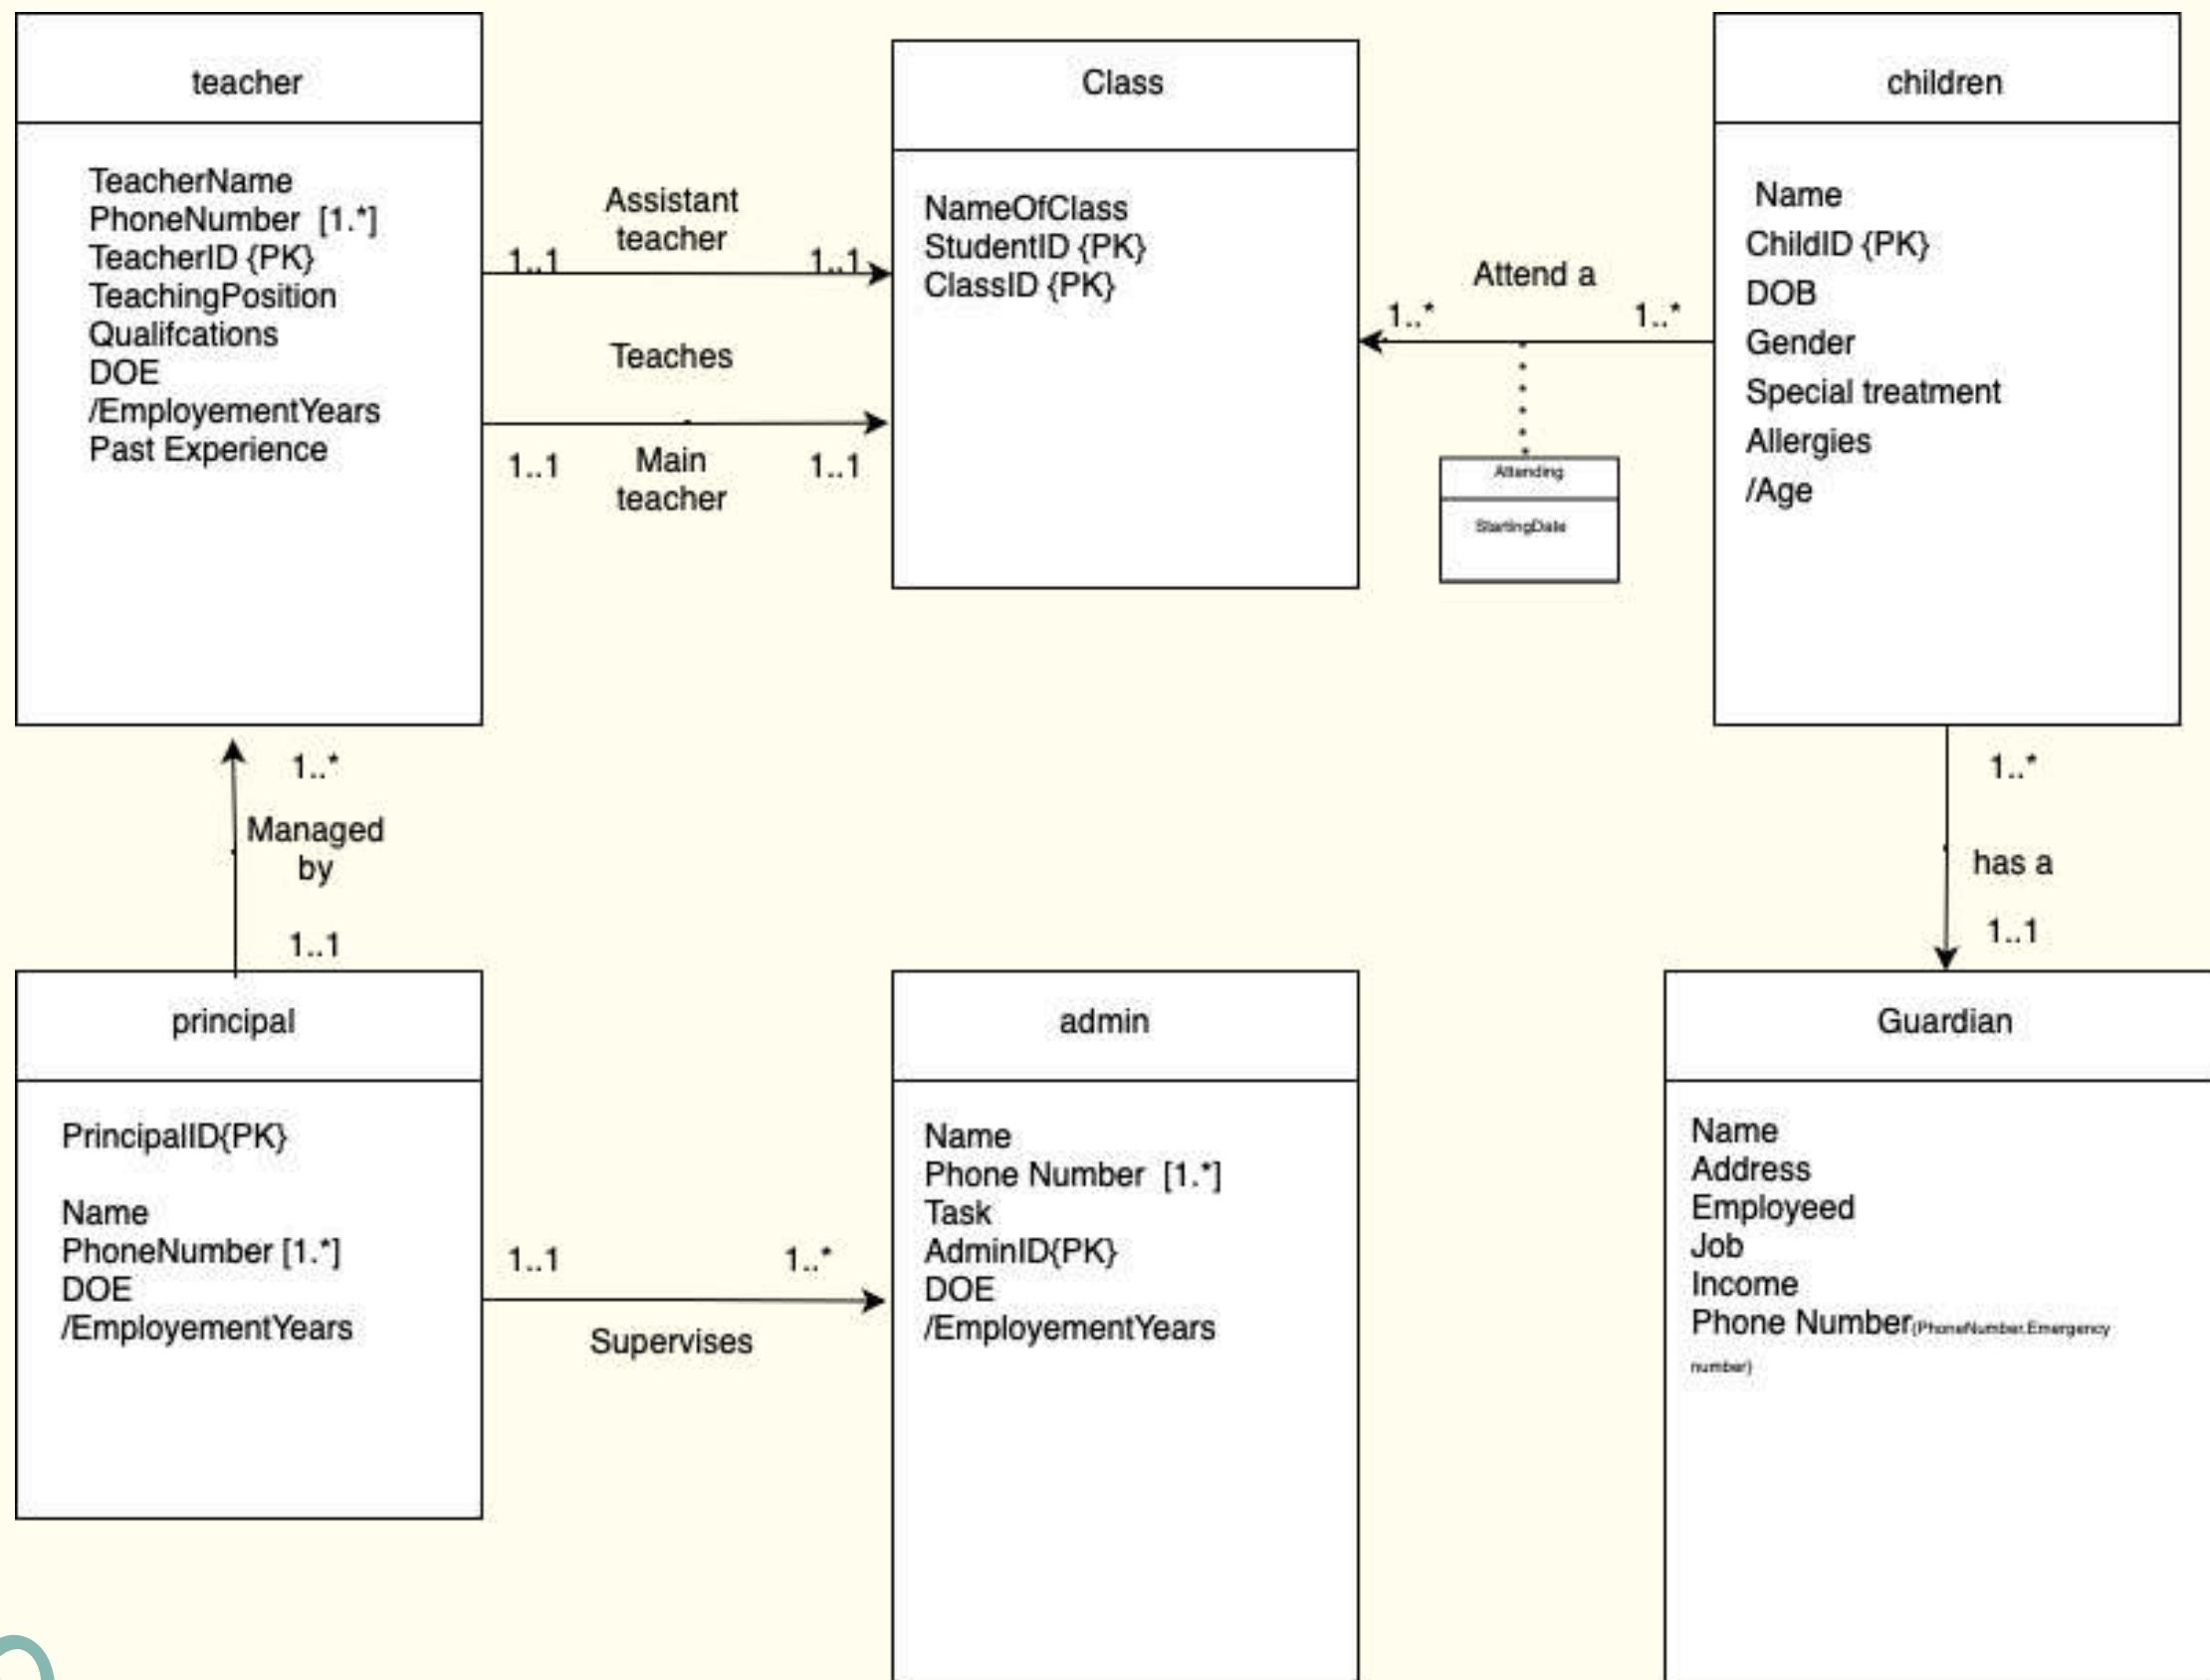

BUSINESS RULES

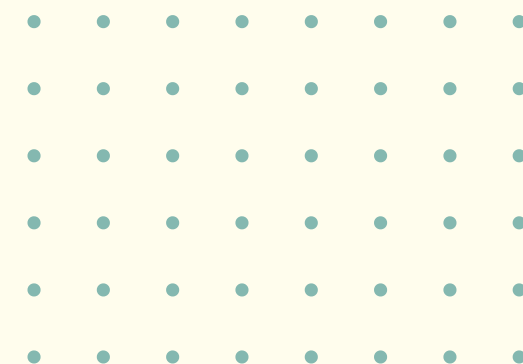

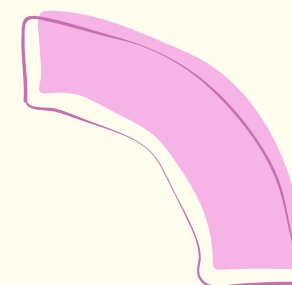

- all administrators have a name, phone number, ID, tasks, DOE, qualifications, past experience.
- there are 75 children in the kindergarten, as well as 10 teachers, 5 of whom are main teachers that are in charge of the classes, and the other 5 are assistant teachers. its very essential to have assistant teachers in kindergartens due to the fun and out-there nature of children that requires more than one supervision!.
- each class in our kindergarten is taught by 1 main teacher and 1 assistant teacher, it also has a maximum capacity of 15 children, to ensure that each child gets the best care and attention for their education and well being.
- besides the teachers, there are 5 administrators, all of which have different tasks in our kindergarten.
- it is worth noting that a parent can have multiple children registered in our kindergarten!.

PHASE 2:

RELATIONAL MAPPING

in the next slides we will display the steps we did that will result in the suitable mapping for our data base, taking into consideration that some steps were not needed.

STEP 1

in the first step
we mapped out our regular entities
using relations
that include all their simple attributes

children

Gender	DOB	special treatment	allergies	name	<u>childID</u>	Age
--------	-----	-------------------	-----------	------	----------------	-----

class

Number Of Childern	NameOfClass	<u>class ID</u>
--------------------	-------------	-----------------

Teacher

TeacherName	<u>teacherID</u>	DOE	qualification	past experience	employmant yeas	position
-------------	------------------	-----	---------------	-----------------	-----------------	----------

principal

name	<u>principallID</u>	DOE	employment years
------	---------------------	-----	------------------

Admin

name	<u>AdminID</u>	DOE	employment years	task
------	----------------	-----	------------------	------

STEP 2

in this step
we mapped out the weak entities also
using
relations that include their simple
attributes.

guardian

Name	income	phone number	emergency number	job	employeeed	address
------	--------	--------------	------------------	-----	------------	---------

children

Gender	DOB	special treatment	allergies	name	<u>childID</u>	Age
--------	-----	-------------------	-----------	------	----------------	-----

class

Number Of Childern	NameOfClass	<u>class ID</u>
--------------------	-------------	-----------------

Teacher

TeacherName	<u>teacherID</u>	DOE	qualifcation	past experience	employmant years	position
-------------	------------------	-----	--------------	-----------------	------------------	----------

principal

name	<u>principalID</u>	DOE	employment years
------	--------------------	-----	------------------

Admin

name	<u>AdminID</u>	DOE	employment years	task
------	----------------	-----	------------------	------

STEP 3

for this step, we identified our
1:1 relationships and then mapped
them out
using the appropriate procedures

guardian

Name	income	phone number	emergency number	job	employeeed	address
------	--------	--------------	------------------	-----	------------	---------

children

Gender	DOB	special treatment	allergies	name	<u>childID</u>	Age
--------	-----	-------------------	-----------	------	----------------	-----

class

Number Of Childern	NameOfClass	<u>class ID</u>	main teacher	assistant teacher
--------------------	-------------	-----------------	--------------	-------------------

Teacher

TeacherName	<u>teacherID</u>	DOE	qualification	past experience	employment yeas	position
-------------	------------------	-----	---------------	-----------------	-----------------	----------

principal

name	<u>principalID</u>	DOE	employment years
------	--------------------	-----	------------------

Admin

name	<u>AdminID</u>	DOE	employment years	task
------	----------------	-----	------------------	------

STEP 4

for this step, we identified our
1:M relationships and then mapped
them out
using the appropriate procedures

guardian

Name	income	phone number	emergency number	job	employeeed	address
------	--------	--------------	------------------	-----	------------	---------

children

Gender	DOB	special treatment	allergies	name	<u>childID</u>	Age	guardian name
--------	-----	-------------------	-----------	------	----------------	-----	---------------

class

Number Of Childern	NameOfClass	<u>class ID</u>	main teacher	assistant teacher
--------------------	-------------	-----------------	--------------	-------------------

Teacher

TeacherName	<u>teacherID</u>	DOE	qualification	past experience	employmant yeas	position	manager
-------------	------------------	-----	---------------	-----------------	-----------------	----------	---------

principal

name	<u>principalID</u>	DOE	employment years
------	--------------------	-----	------------------

Admin

name	<u>AdminID</u>	DOE	employment years	task	supervisor
------	----------------	-----	------------------	------	------------

STEP 5

for this step, we identified our
M:N relationships and then mapped
them out
using the appropriate procedures

guardian

Name	income	phone number	emergency number	job	employeeed	address
------	--------	--------------	------------------	-----	------------	---------

children

Gender	DOB	special treatment	allergies	name	<u>childID</u>	Age	guardian name
--------	-----	-------------------	-----------	------	----------------	-----	---------------

attending

childID	classID
---------	---------

class

Number Of Childern	NameOfClass	<u>class ID</u>	main teacher	assistant teacher
--------------------	-------------	-----------------	--------------	-------------------

Teacher

TeacherName	<u>teacherID</u>	DOE	qualification	past experience	employmant yeas	position	manager
-------------	------------------	-----	---------------	-----------------	-----------------	----------	---------

principal

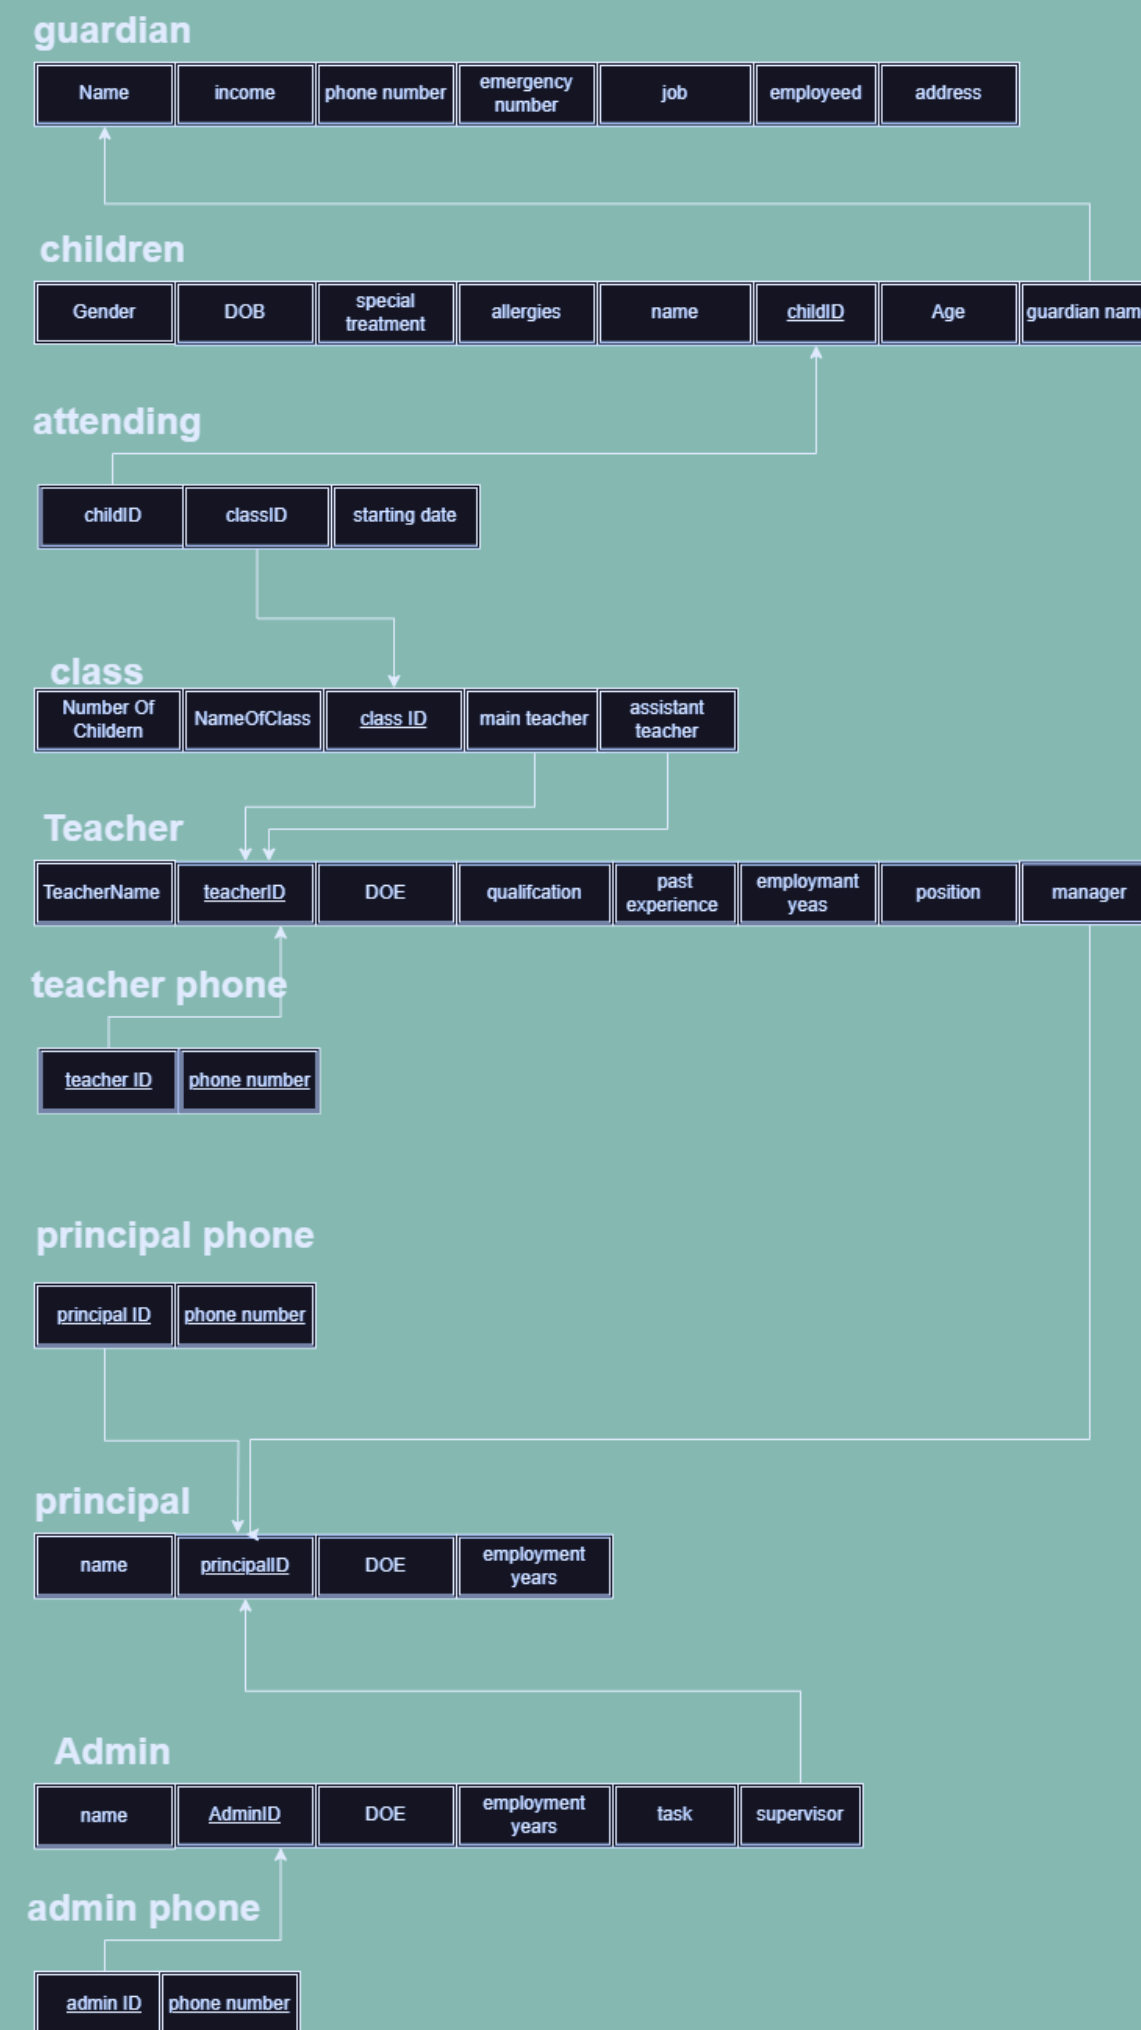

name	<u>principallID</u>	DOE	employment years
------	---------------------	-----	------------------

Admin

name	<u>AdminID</u>	DOE	employment years	task	supervisor
------	----------------	-----	------------------	------	------------

STEP 6

for this step, it was time to map out our multivalued attributes using the procedures that fit them.

STEP 7

**for step 7, we examined our ER diagram and UML, and we came to the conclusion that our data base does not have any N-ary relationships to map out.
so step 7 was not needed.**

NORMALIZATION TIME!

**now its time to begin the normalization
process to decrease the chance of
redundancy in our data base and organize
it to the best of our abilities!**

1st normal form

to complete the first normal form, we made sure that there are no multivalued attributes or repeating groups.

Teacher

TeacherName	<u>teacherID</u>	DOE	employant yeas	position	manager
-------------	------------------	-----	-------------------	----------	---------

teacher experience

past experience	<u>teacherID</u>
--------------------	------------------

teacher qualifications

qualifcation	<u>teacherID</u>
--------------	------------------

teacher phone

<u>teacher ID</u>	<u>phone number</u>
-------------------	---------------------

1NF

This table has 3 multi-valued (Experience - Quaifications - phone)
After separating the tables, three tables will be produced

teacherID → past xxperience

teacher ID → Qualifcation

teacherID → phone

1st normal form

to complete the first normal form, we made sure that there are no multivalued attributes or repeating groups.

principal

name	<u>principalID</u>	DOE
------	--------------------	-----

principal phone

<u>principal ID</u>	<u>phone number</u>
---------------------	---------------------

1NF
in this table we have 1 multi-valued (phone number)

principalID $\Rightarrow$ phone number

Admin

name	<u>AdminID</u>	DOE	task	supervisor
------	----------------	-----	------	------------

admin phone

<u>admin ID</u>	<u>phone number</u>
-----------------	---------------------

1NF
in this table we have 1 multi-valued (phone number)

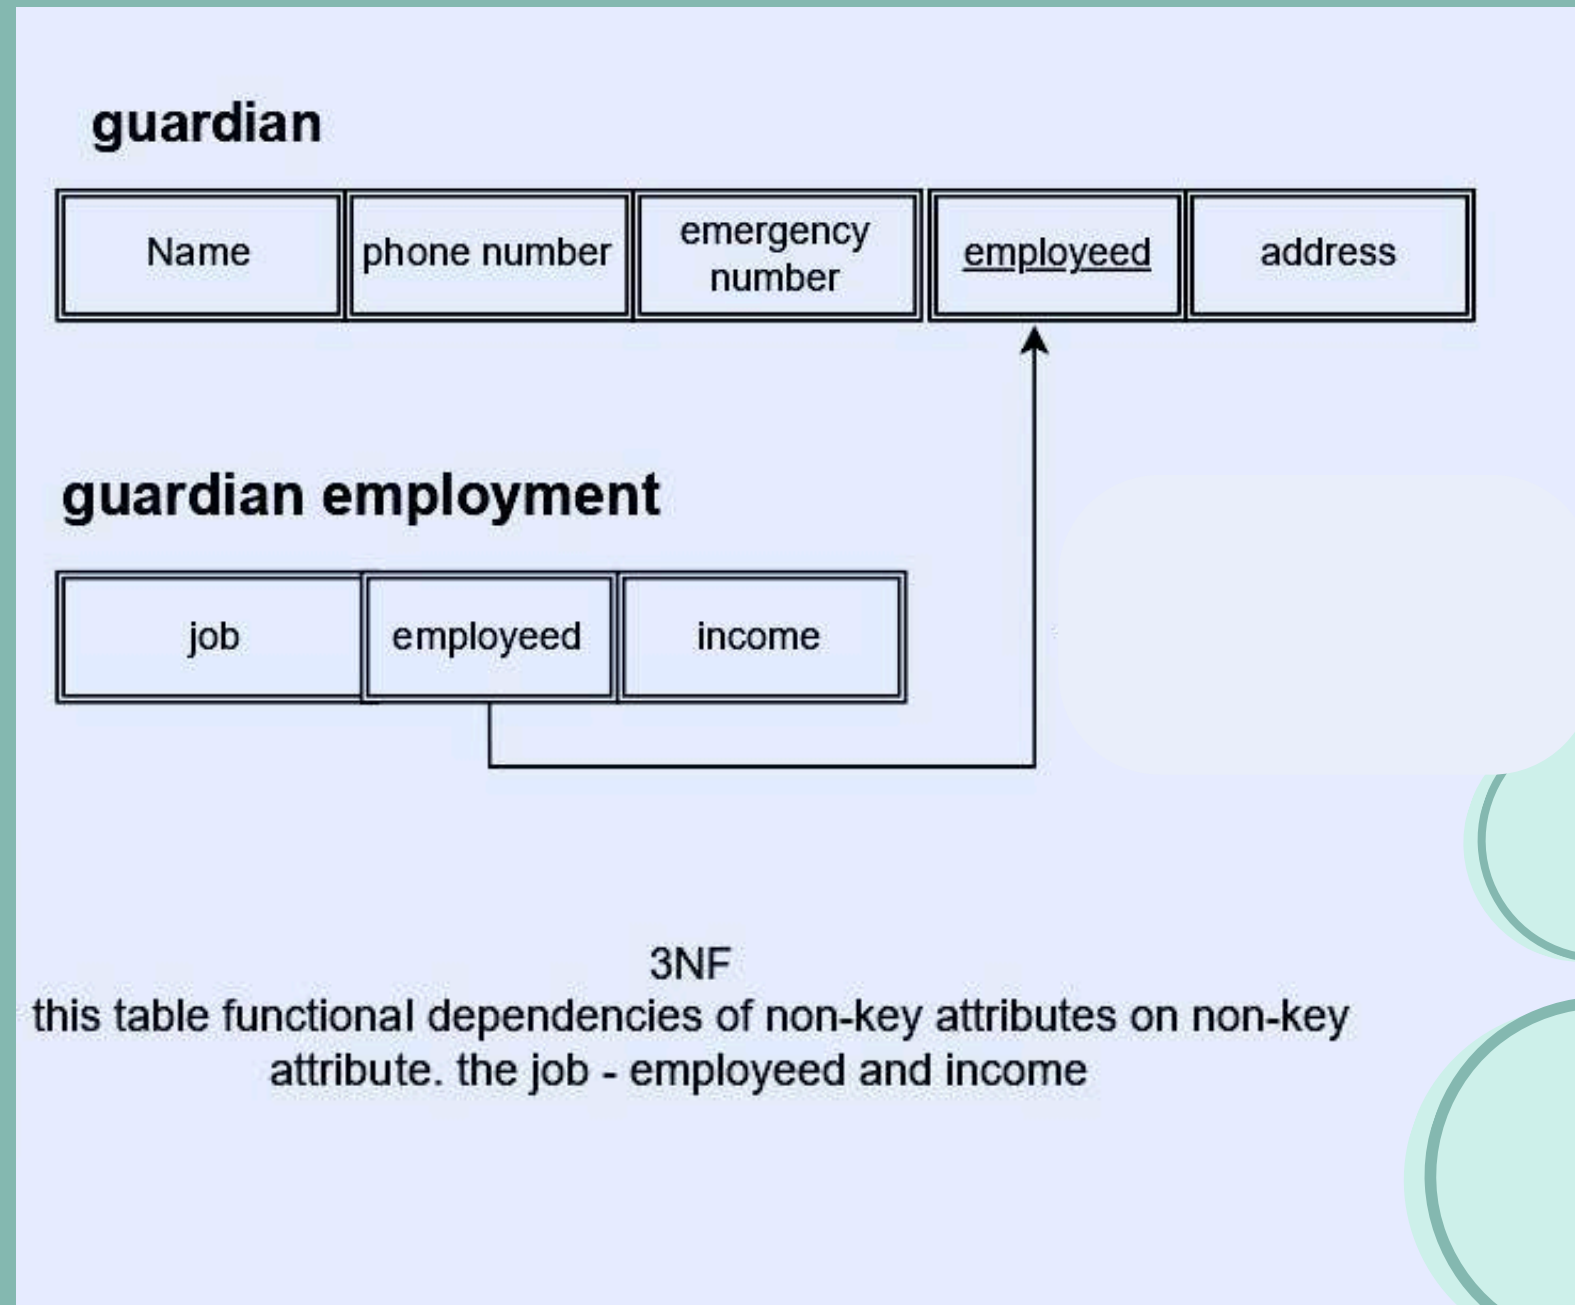

AdminIID $\Rightarrow$ phone number

2ND NORMAL FORM

All Relations are already in the second normal form due to the fact that we don't have composite keys, therefore a partial dependency cannot exist.

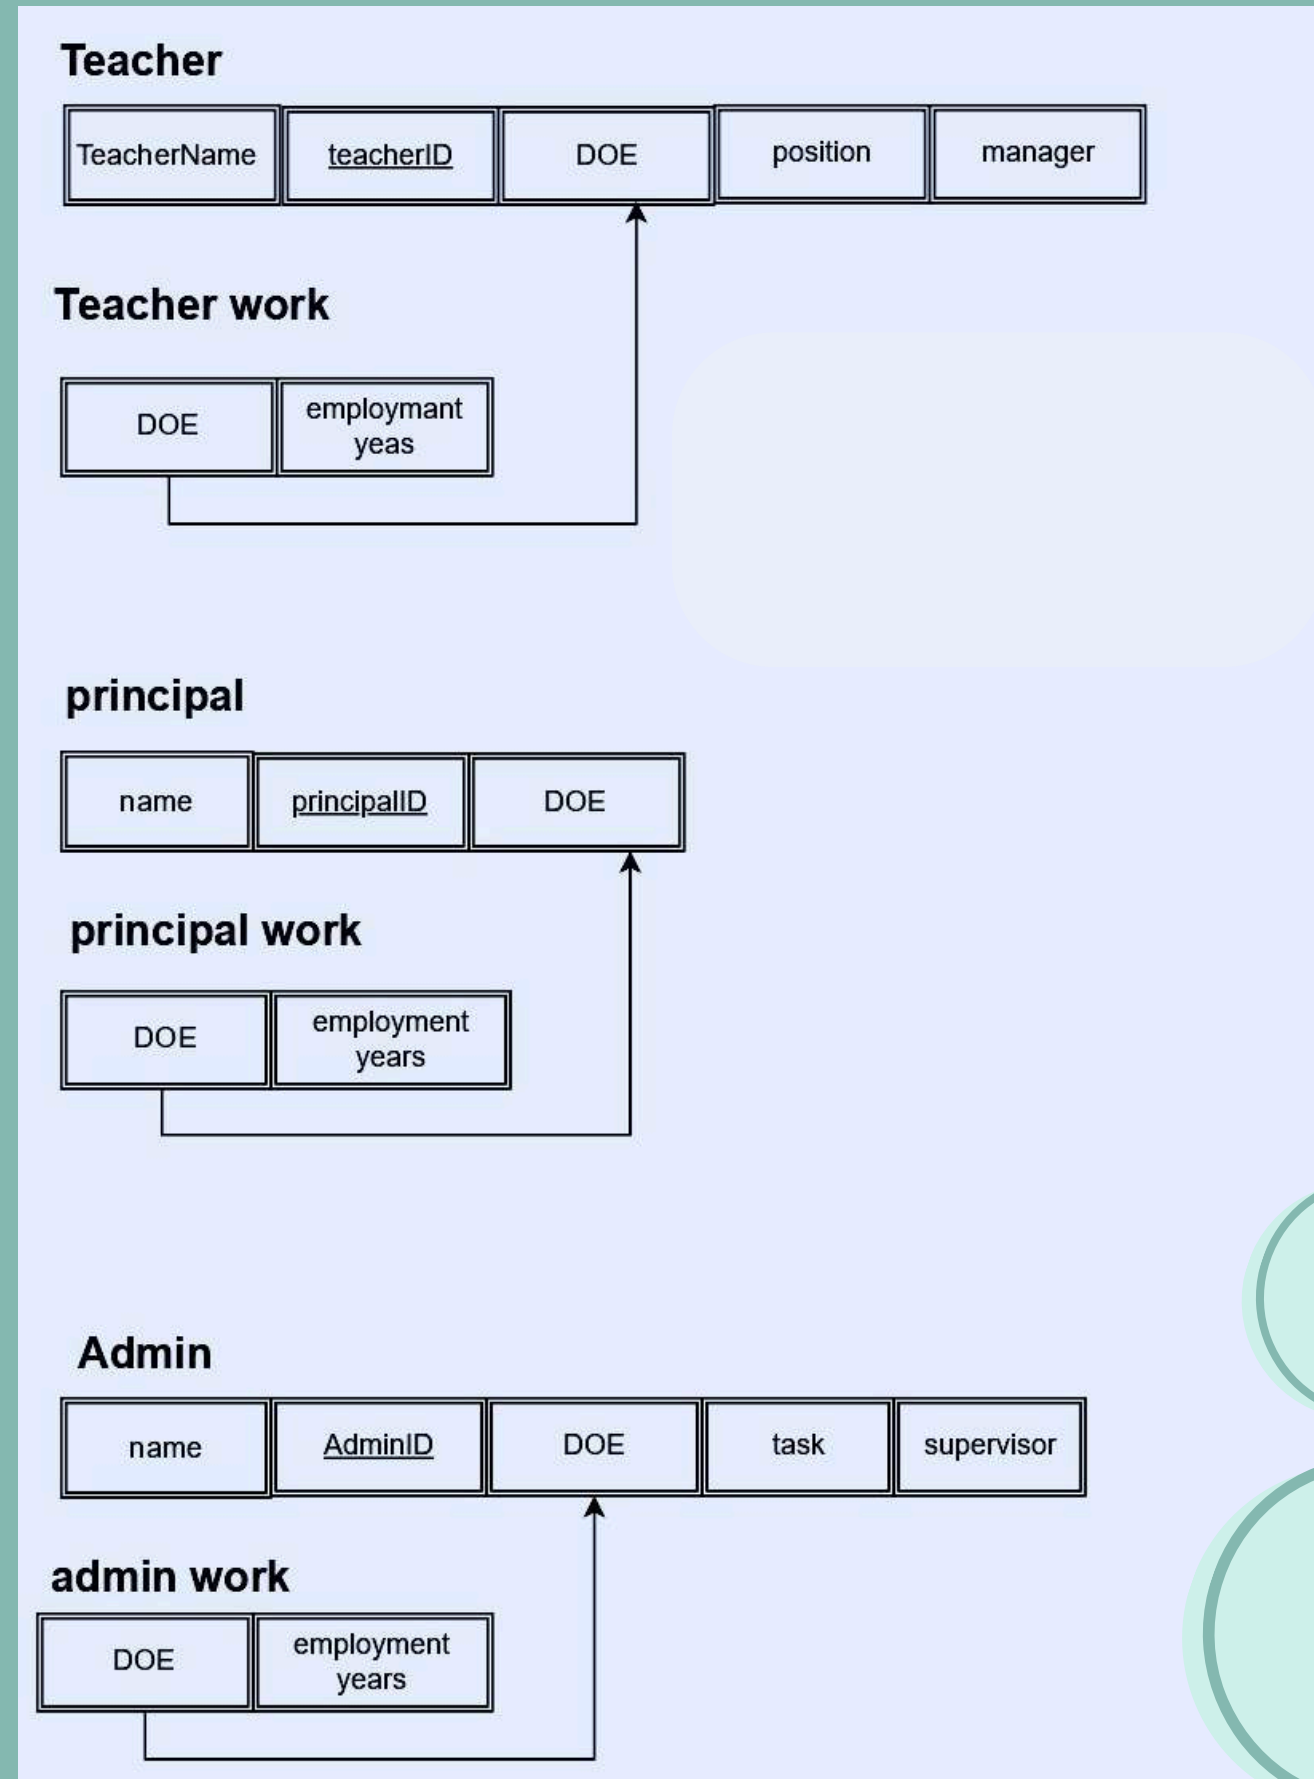

3rd normal form

to complete the third normal form, we had to remove all the transitive dependencies

3rd normal form

in teacher, principal,
admin, tables
the attribute
employment years
Depends on DOE

FINAL MAPPING AND NORMALIZATION

Guardian

<u>name</u>	phone_number	emergency_phoneNumber	address
-------------	--------------	-----------------------	---------

Guardian_employment

job	employeeed	income	name
-----	------------	--------	------

child

gender	special treatment	allergies	name	<u>childID</u>	guardian_name
--------	----------------------	-----------	------	----------------	---------------

child_age

DOB	childID
-----	---------

principal

name	<u>principalID</u>
------	--------------------

principal_phone

<u>principalID</u>	<u>phone_number</u>
--------------------	---------------------

principal_work

<u>principalID</u>	<u>DOE</u>
--------------------	------------

PHASE 2 WORK

PLEASE 3:

table creation

creating the schema for the project and using it

creating the guardian and guardian employment tables with their attributes

```
CREATE DATABASE IF NOT EXISTS KindergartenManagementSystem;  
use KindergartenManagementSystem;
```

```
CREATE TABLE IF NOT EXISTS guardian(  
  name VARCHAR(30) NOT NULL,  
  phone_number int(10) NOT NULL,  
  emergency_phoneNumber int(10) NOT NULL,  
  address VARCHAR(50) NOT NULL,  
  constraint name_pk PRIMARY KEY(name)  
);
```

```
CREATE TABLE IF NOT EXISTS guardian_employment(  
  job varchar(50),  
  employeed VARCHAR(3),  
  income int(10),  
  name VARCHAR(30),  
  constraint name_fk FOREIGN KEY(name)  
  REFERENCES guardian(name)  
);
```

due to the large number of data that we've inserted, some foreign key issues presented themselves and we had no option but to use this command to progress through the phase and complete the project.

- SET FOREIGN_KEY_CHECKS=0;

table creation

**creating the child and
child age tables with
their attributes**

```
CREATE TABLE IF NOT EXISTS child(  
  gender VARCHAR(1) CHECK(gender IN ('F','M')),  
  special_treatment VARCHAR(200),  
  allergies VARCHAR(100),  
  name VARCHAR(50) NOT NULL,  
  childID INT(4) NOT NULL ,  
  guardian_name VARCHAR(30),  
  constraint guardian_name_fk FOREIGN KEY(guardian_name)  
  REFERENCES guardian(name),  
  constraint childID_pk PRIMARY KEY(childID)  
);  
  
CREATE TABLE IF NOT EXISTS child_age(  
  DOB VARCHAR(10),  
  childID int(4),  
  constraint childageID_fk FOREIGN KEY (childID) references child(childID),  
  constraint childID_DOB_pk PRIMARY KEY(childID,DOB)  
);
```

table creation

```
CREATE TABLE IF NOT EXISTS principal(  
  name VARCHAR(30),  
  principalID int(5) NOT NULL UNIQUE,  
  constraint principalID_pk PRIMARY KEY(principalID)  
);  
  
CREATE TABLE IF NOT EXISTS principal_phone(  
  principalID int(5),  
  phoneNumber int(10),  
  constraint principalID_fk FOREIGN KEY(principalID) references principal(principalID),  
  constraint principalID_phoneNumber_pk PRIMARY KEY(principalID,phoneNumber)  
);  
  
CREATE TABLE IF NOT EXISTS principal_work(  
  principalID int(5),  
  DOE VARCHAR(10) ,  
  constraint DOE_fk foreign key(principalID) references principal(principalID),  
  constraint principalID_DOE_pk PRIMARY KEY(principalID,DOE)  
);
```

**creating the principal
table and the tables
for their phone
number and work**

table creation

```
CREATE TABLE IF NOT EXISTS teacher( /*10 teacher */
name VARCHAR(30),
teacherID int(5)NOT NULL UNIQUE,
DOE VARCHAR(10),
position VARCHAR(20) CHECK (position IN ('Main Teacher','Assistant Teacher') ),
managerID int(5),
qualifications varchar(200),
constraint teacherID_pk PRIMARY KEY(teacherID),
constraint managerID_fk FOREIGN KEY(managerID)references principal(principalID)
);

CREATE TABLE IF NOT EXISTS class(
num_of_children INT(2) CHECK (num_of_children <= 15),
classID int(2) NOT NULL UNIQUE,
mainTeacher int(5),
assistantTeacher int(5),
name_of_class VARCHAR(30) NOT NULL UNIQUE,
constraint classID1_pk PRIMARY KEY(classID),
constraint mainTeacherinClass_fk FOREIGN KEY(mainTeacher)references teacher(teacherID),
constraint assistantTeacherinClass_fk FOREIGN KEY(assistantTeacher)references teacher(teacherID)
);
```

**creating the teacher
table and the class
table**

table creation

**creating the attendance
table and the tables for
the teachers experiences
and phone numbers**

```
CREATE TABLE IF NOT EXISTS attending(  
  childID INT(2),  
  classID INT(2),  
  starting_date VARCHAR(10),  
  constraint childIDattends_fk foreign key(childID)references child(childID),  
  constraint classID FOREIGN KEY(classID)references class(classID)  
);
```

```
